# 1 The Basics of Computation

## 1.1 Decision Problems

A decision problem is a problem which has a **Yes** or **No** answer.

### 1.1.1 Decomposing Decision Problems

A decision problem can be decomposed into two sets, the **Yes** and **No** instances of the problem.

## 1.2 Alphabets

An alphabet is finite set whose members are called symbols (or equivalently letters or characters).

### 1.2.1 Strings

A string (or equivalently word) over an alphabet  $\Sigma$  is a finite sequence of symbols from  $\Sigma$ . The sequence may be empty, such sequences are denoted by  $\epsilon$ . The amount of symbols in a string  $w$  is denoted by  $|w|$ .

### 1.2.2 The Set of Strings

The set of all strings over  $\Sigma$  is denoted by  $\Sigma^*$ .

### 1.2.3 Substrings and Concatenation

For two strings  $v, w$ ,  $v$  is a substring of  $w$  if it appears consecutively in  $w$ .

We write  $vw$  to denotes  $v$  concatenated with  $w$  and for  $k$  in  $\mathbb{Z}_{>0}$ , we say  $v^k$  is the  $k$ -fold concatenation of  $v$  with itself ( $k$  copies of  $v$ ).
